ART UNIT	PAPER NUMBER
2611	

MAIL DATE	DELIVERY MODE
05/22/2009	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) ☒ Responsive to communication(s) filed on <u>08 January 2009</u>.

2a) ☒ This action is **FINAL**.   2b) ☐ This action is non-final.

3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) ☒ Claim(s) <u>1-6 and 8-16</u> is/are pending in the application.

     4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5) ☐ Claim(s) _____ is/are allowed.

6) ☒ Claim(s) <u>1-6, 8-16</u> is/are rejected.

7) ☐ Claim(s) _____ is/are objected to.

8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) ☐ The specification is objected to by the Examiner.

10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.

     Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

     Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

     a) ☐ All   b) ☐ Some *   c) ☐ None of:

         1. ☐ Certified copies of the priority documents have been received.

         2. ☐ Certified copies of the priority documents have been received in Application No. _____.

         3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

     * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☐ Notice of References Cited (PTO-892)

2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3) ☐ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date _____.

4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____

5) ☐ Notice of Informal Patent Application

6) ☐ Other: _____.

DETAILED ACTION

1.   This action is in response to the amendment filed on January 08, 2009. Claims 1-

6 and 8-16 are pending and have been considered below.

Response to Arguments

2.   The amendment corrected the antecedent basis problems in claims 1 and 11.

Therefore, the 112 rejection to claims 1-6 and 8-15 is withdrawn.

3.   Amendment failed to fully correct the antecedent problems in claim 16, so the

112 rejection to claim 16 is upheld.

4.   Applicant's arguments filed January 08, 2009 have been fully considered but they

are not persuasive.

5.   Applicant's argument "…Wright mentions that the gradients of amplitude, phase

and frequency trajectories are continuous and bandlimited (see, for example, col. 21,

lines 15-18). However, Wright does not mention calculating an approximation of a

gradient of expectation of the obtained difference…" (Remarks, page 7-8), is

respectfully traversed by the Examiner because the prior art reference Wright, as cited

in the previous office action discloses obtaining difference between output of signal

processing circuitry and input of pre-equalization function (column 31, lines 15-55), and

a secondary reference Pare Jr. is used that discloses the argued part of calculating

approximation of a gradient. Therefore, the above argument is moot, that Wright does

not describe this above mentioned limitation.

6.   The argument offered by Applicant that "...Pare, Jr only discusses

the use of a least-mean-square process, and does not disclose the use of an

approximation of a gradient of expectation of a square of the difference based on the

obtained difference and an approximation of a transmission characteristic..." (Remarks,

page 8) is not persuasive as the least mean square process describe by the secondary

reference Pare Jr. is part of calculation for the adaptive mechanism where the

calculation of the gradient and least mean square are connected in adaptive

optimization (column 28 line64- column 29 line 36), also the present invention describes

use of least mean square technique in the adaptive update of predistortion (specification

page 6).

7.   Applicant argues that "...it appears that the rejection merely identifies the portion

of the claimed invention found lacking in Wright and locates that portion of the claimed

invention in Pare, Jr...The rejection does not consider the context of the passages.

Notwithstanding the reference to the teachings of Pare, Jr, the rejection does not

consider Pare, Jr in its entirety..." (Remarks, page 8). Examiner respectfully traversed

Applicant's opinion as according to the MPEP 2123 [R-5]

II. NONPREFERRED AND ALTERNATIVE EMBODIMENTS CONSTITUTE PRIOR ART

Disclosed examples and preferred embodiments do not constitute a teaching away from a broader disclosure or nonpreferred embodiments. *In re Susi*, 440 F.2d 442, 169 USPQ 423 (CCPA 1971). "A known or obvious composition does not become patentable simply because it has been described as somewhat inferior to some other product for the same use." *In re Gurley*, 27 F.3d 551, 554, 31 USPQ2d 1130, 1132 (Fed. Cir. 1994) (The invention was directed to an epoxy impregnated fiber-reinforced printed circuit material. The applied prior art reference taught a printed circuit material similar to that of the claims but impregnated with polyester-imide resin instead of epoxy. The reference, however, disclosed that epoxy was known for this use, but that epoxy impregnated circuit boards have "relatively acceptable dimensional stability" and "some degree of flexibility," but are inferior to circuit boards impregnated with polyester-imide resins. The court upheld the rejection concluding that applicant's argument that the reference teaches away from using epoxy was insufficient to overcome the rejection since "Gurley asserted no discovery beyond what was known in the art." 27 F.3d at 554, 31 USPQ2d at 1132.). Furthermore, "[t]he prior art's mere disclosure of more than one alternative does not constitute a teaching away from any of these alternatives because such disclosure does not criticize, discredit, or otherwise discourage the solution claimed...." *In re Fulton*, 391 F.3d 1195, 1201, 73 USPQ2d 1141, 1146 (Fed. Cir. 2004).

"...The prior art's mere disclosure of more than one alternative does not constitute a teaching away from any of these alternatives because such disclosure does not criticize, discredit , or otherwise discourage the solution claimed..." As in the present case use of least mean square technique for calculating adaptive parameters based on gradient of error signal are implementable for updating a transmission system characteristics based on the amplifier characteristics.

8.　　　The argument that "... claim 1 recites the feature that "said transmission characteristic of said signal processing circuitry is approximated as a delay function." However, the rejection apparently regards the adaptive control processing and

compensation estimator (ACPCE) 28… of Wright having a delay block or function

… The approximation circuit 73 at page 8 of the specification implements a filter

characteristic as a delay block or function. The ACPCE 28 in Wright is not the same as

or equivalent to this approximation circuit or to the recited feature. It has signal values

filled in a memory to be held. In other words, they are delayed before further

processing…" (Remarks, page 9) is respectfully traversed because, principally the

Wright is doing the similar kind of distortion compensation as produced by analog

components i.e. filters in the circuit (column 26, lines 40-67, and similarly described in

present invention specification page 2) and the adaptation characteristics are

implemented in compensation circuitry as delay function has delay block or function as

specifically shown in figure 16 and described in related columns as above. Therefore,

based on above the rejection is upheld.

Claim Rejections - 35 USC § 112

9.   The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly
> claiming the subject matter which the applicant regards as his invention.

10.   Claim 16 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite

for failing to particularly point out and distinctly claim the subject matter which applicant

regards as the invention.

11.   Claim 16 recites the limitation "…the gradient of the expectation of the square... "

in lines 6-8. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 103

12.   The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set
> forth in section 102 of this title, if the differences between the subject matter sought to be patented and
> the prior art are such that the subject matter as a whole would have been obvious at the time the
> invention was made to a person having ordinary skill in the art to which said subject matter pertains.
> Patentability shall not be negatived by the manner in which the invention was made.

13.   Claims 1, 2, 4-6, 8 and 11-16 are rejected under 35 U.S.C. 103(a) as being

unpatentable over Wright et al. (US 6,313,703) in view of Pare, Jr. et al. (US 6,834,109).

Regarding Claims 1, 11 and 16:

Wright et al discloses a system and method for pre-equalization, comprising:

obtaining a difference between an output signal of a signal processing circuitry

and an input signal of an pre-equalizing function (figure 20; figure 21; column 31, lines

15-26 and 45-55; equation 22 in column 32), wherein said input signal is filtered by said

pre-equalizing function and the output signal of said pre-equalizing function is input to

said signal processing circuitry (pre-equalizer 21 in figures 2-3, as shown pre-equalizer

filters the input signal see figure 9, and send output to signal processing circuitry, as

described in present invention the pre-equalizer 15 in figures 1-3 is equivalent to pre-

equalizer 21 in Wright);

updating control values of said equalizing function (column 4, lines 38-42; column

9, lines 5-11) based on said approximated gradient (column 23, lines 60-67);

wherein said transmission characteristic of said signal processing circuitry is

approximated as a delay function (figures 14 and 16; column 26 line 54 - column 27 line

5; as described in present invention, specification page 8 the approximation circuit 73 may be adapted to implement filter characteristic ...as delay block or function; similarly Wright's adaptation circuit 28 in figure 14 has delay block or function as specifically shown in figure 16 and described in related columns as above).

Wright discloses all of the subject matter as described above and further discloses calculating an approximation of a gradient of expectation of said difference based on said obtained difference and an approximation of a transmission characteristic (column 21, lines 15-20; equations 22-24 in column 32; column 23, lines 60-67; column 19, lines 38-44; columns 53-54, see step 2), except that the calculated approximation is based on a gradient of expectation of a square of said difference based on said obtained difference and an approximation of a transmission characteristic.

However, Pare, Jr. in the same field of endeavor discloses apparatus and method for mitigation of disturbers in communication system see figures 20-22, by calculating an approximation of a gradient of expectation of a square of said difference based on said obtained difference and an approximation of a transmission characteristic (column 28, line 60 - column 29, line 40).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use the teachings of Pare Jr. in the Wright system to calculate the approximate gradient of based on based on expected value of squared error signal in order to compensate non linearities and interferences as cross talk interference in the communication system by determining and estimation of interference and non linearities

that may be caused by external sources or are due to system internal components for
getting optimal and predictable performance.

Regarding Claim 2:

Wright et al discloses all of the subject matter as described above and further
discloses calculating an approximation of a least mean square gradient vector (column
23, lines 62-65) of said difference.

Regarding Claims 4 and 12:

Wright et al discloses all of the subject matter as described above and further discloses
the difference or error is obtained by comparing signal envelopes of said output and
input signals (figures 20 and 221; column 31, lines 35-42).

Regarding Claim 5:

Wright et al discloses all of the subject matter as described above and further
discloses input signal is a digital signal and said output signal is an analog signal (12
and 18 in figure 2; column 4, lines 10-16).

Regarding Claim 6:

Wright et al discloses all of the subject matter as described above and further
discloses the control values are coefficients of an adaptive digital filter (92, 93 in figure 9
are digital filters; figure 10A shows coefficients of filters).

Regarding Claim 8:

Wright et al discloses all of the subject matter as described above and further
discloses the delay function corresponds to the position of the maximum analog filter
peak of said transmission characteristic (column 25, lines 30-34).

Regarding Claim 13:

Wright et al discloses all of the subject matter as described above and further

discloses calculating an approximation of a least mean square gradient vector (column

23, lines 62-65) of said difference and the transmission characteristic is approximated

as a delay function (as clearly shown if figure 13 which is block 28 of figure 2; column

22, lines 50-62, where the signal values are filled in memory to hold i.e. delayed before

further processing).

Regarding Claim 14:

Wright et al discloses all of the subject matter as described above and further

discloses signal processing circuitry is a direct conversion (column 10, lines 15-22) or

heterodyne transmitter architecture.

Regarding Claim 15:

Wright et al discloses all of the subject matter as described above and further

discloses the apparatus comprises a digital pre-equalizer means (clearly shown in figure

2, the pre-equalizing means for pre distorting the signal is in the digital domain).

14.   Claims 3 and 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable

over Wright et al. (US 6,313,703) in view of Pare, Jr. et al. (US 6,834,109) as applied to

claims 1, 2, and 8 above, in view of Daniel et al. ("JOINT GRADIENT-BASED TIME

DELAY ESIMATION AND ADAPTIVE FILTERING" IEEE CH2868; pages 3165-3169;

1990)

Regarding Claim 3:

Wright et al discloses all of the subject matter as described above except for specifically teaching the gradient vector is calculated from a partial differential equation of a system cost function.

However, Daniel et al in the same field of endeavor discloses an adaptive filter using gradient based time delay estimation and further discloses that the gradient i.e. the function for updating the adaptation coefficients is in the form of a differential equation (page 3167, equations 24-26, 38-39).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use the partial differential equation of system cost function to get the gradient vector for updating adaptation coefficients to take advantage of partial differential equations as they are used to formulate and solve problems that involve unknown functions of several variables as in this case the filter circuit characteristics, temperature changes and supply voltage. Using the partial differential equation to formulate the gradient based on the error value of input and output signals makes it easier to keep the adaptation means updated.

Regarding Claim 9:

Wright et al discloses all of the subject matter as described above except for specifically teaching the gradient vector is calculated using the following equation:

$\nabla\{E\} = -2e[k].\, d[k-x]$,

wherein $\nabla\{E\}$ denotes said gradient vector, $e[k]$ denotes said obtained difference, and $d[k-x]$ denotes a vector representation of said input signal assessed by said delay approximation of said transmission characteristic.

However, Daniel et al in the same field of endeavor discloses an adaptive filter using gradient based time delay estimation where the filter coefficients are updated according to the equation $E[Wn + 1] = E[Wn] + 2\mu E[e(n,dn) Un]$, where e_n is the error/difference signal and Un is a delayed input vector (page 3167, equation 43). This equation can be written in the form of a gradient i.e. in the form of ratio of different variables where $E[Wn + 1] - E[Wn] = 2 \mu E[e(n, dn) Un]$ and the gradient vector is calculated.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to update the adaptation values based on the gradient of the difference between output and input values where the input is a delayed function in order to make the adaptation coefficients which reflects the distortions and discrepancies in the filtering circuit when the error signal is compared to the delayed input signal, to keep track of the time varying delays in the path of signals going through separate processes.

Regarding Claim 10:

Wright et al discloses all of the subject matter as described above except for specifically teaching the filter coefficients are updated in said updating step based on the following equation:

$w[k + 1] = w[k] + \mu e[k] \cdot d[k- \tau]$,

wherein $w[k + 1]$ denotes a vector representation of updated filter coefficients, $w[k]$ denotes a vector representation of current filter coefficients, and μ denotes a predetermined proportionality factor.

However, Daniel et al in the same field of endeavor discloses an adaptive filter using gradient based time delay estimation where the filter co-efficients are updated according to the equation w[n + 1] = w[n] + 2μe* Un, where Un is a delayed input vector (page 3166, equation 20).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to update the adaptation coefficients based on the previous value and the error signal and the delayed input signal in order to make it easier for the system just to update the previous coefficients and not to determine the new ones as just making the required changes in the previous value saves some extra calculation and time and makes the system less complex.

Conclusion

15.   **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to HIRDEPAL SINGH whose telephone number is (571) 270-1688. The examiner can normally be reached on Mon-Fri (Alternate Friday Off) 8:30AM-6:00PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shuwang Liu can be reached on 571-272-3036. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
